

Project Design Phase-II Customer Journey Map

Field	Details
Date	29 September 2026
Team ID	SWTID-2026-1012
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	4 Marks

Scenario: Agent creates and updates a High Impact Incident record in ServiceNow

Stage	Entice	Enter	Engage	Exit	Extend
Steps	Agent logs into ServiceNow	Opens Incident form / New Incident	Sets Impact = High; UI Policy makes Assignment group mandatory and Urgency read-only; onChange auto-sets Urgency	Submits form (onSubmit checks Assigned To)	Views/edits from list view later (onCellEdit blocks State edit)
Goals & Motivations	Help me log the issue fast	Help me know what's required for high impact	Help me not forget to assign an owner	Help me submit without missing Assigned To	Help me change State safely, not by accident
Positive Moments	Easy login	Clean form layout	Urgency auto-sets to High - feels guided	Save succeeds smoothly once Assigned To is filled	Form-based State update works fine
Negative Moments	-	Unsure Assigned To is required for High Impact	Urgency used to need manual setting	Save silently allowed without Assigned To (before fix)	State could be changed accidentally from list view (before fix)
Areas of Opportunity	-	Add clear hint for High Impact requirements	Auto-set Urgency for High Impact (solved via onChange)	Block invalid submits with clear alert (solved via onSubmit)	Block inline State edits from list (solved via onCellEdit)
