

Project Design Phase Solution Architecture

Field	Details
Date	29 September 2026
Team ID	SWTID-2026-1012
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	4 Marks

Architecture Diagram (Flow):

[Agent Browser]

|

v

[ServiceNow Incident Form / List View - Client Side]

|

|--> High Impact Control UI Policy Engine (condition: Impact = 1-High)

|

|

v

| UI Policy Actions (Assignment group = Mandatory, Urgency = Read-only)

|

|--> onChange Client Script 'Auto set urgency for high impact' (GlideForm API - g_form)

| --> sets Urgency = High when Impact = High

|

|--> onSubmit Client Script 'Prevent save if Assigned To missing'

| --> blocks save if Impact=High and Assigned To empty

|

|--> onCellEdit Client Script 'Prevent state change via list edit'

--> blocks State field edits from list view

|

v

[ServiceNow Server - Business Rule / ACL Layer]

|

v

[Incident Table - ServiceNow Database]

Explanation:

The architecture is entirely client-side driven for real-time responsiveness, using ServiceNow's native GlideForm (g_form) API. The 'High Impact Control' UI Policy declares the read-only rule for Urgency, while three Client Scripts enforce behavior at different lifecycle stages: onChange auto-sets Urgency, onSubmit validates Assigned To, and onCellEdit protects the State field from list-view edits. All validated data persists in the Incident table on the ServiceNow cloud-hosted database, with role-based ACLs controlling configuration access.
